

ABSTRACT OF THE DISCLOSURE

The invention concerns a method and an apparatus for enhancing delivery of information and accessibility of a receiver. In particular the invention concerns a method for establishing a communication comprising a step of transmitting a request for establishing a communication by a communication terminal, which request is handled by a server. As a response to inability to establish the requested communications, the server returns a failure response including rerouting details to the communication terminal. The communication terminal receives the failure response including rerouting details, and forwards data according to the received rerouting details.
